

OEM APPROVALS

CASE IH

Case IH fully supports the use of B5 in all current and past engines for Case IH agricultural equipment, as well as B20 in more than 90% of the models now being sold in Europe and North America, including Magnum tractors. Nearly half of the models sold globally, including the flagship Axial-Flow 8010 combine, are approved following proper protocols for B100.

Biodiesel used in Case IH engines must meet the requirements of US standard ASTM D6751 or European standard EN 14214. When using blends greater than B5, certain handling and maintenance requirements come into play, and customers are advised to speak with their dealers for the specific recommendations covering their Biodiesel blend of choice.

To determine the maximum Biodiesel blend appropriate for your machine, review the product sections of the Case IH website www.caseih.com

Case IH is committed to working with its partners to push toward higher blend-level Biodiesel that will be a compatible fuel source in future low emissions compliant engines. Case IH continues the aggressive field tests to evaluate performance with B100 on those engines not yet approved.

Biodiesel is a diesel fuel replacement manufactured from vegetable oils, recycled cooking greases or animal fats. Soybeans are the primary source for Biodiesel.
